

Our design was inspired by the yellow pages tree house. It has the ability to support its own structure with its domed shape. The lifeguard tower will be constructed from Douglas fir wood because of its durability, strength, and flexibility.

The interior floors will be plywood. Laminated glass will be used for the main windows for its high strength along with wooden joinery for weather tight capacity.

Subconsent Surf Lifesaving Tower

The functionality of our structure focuses on communication and observation by having two separate heights it helps the life-guards, giving them a wider view when searching for any signs of danger. Having a short distance between the two towers to ensure quick communication..

STRUCTURALLY
HOLDS ITSELF TOGETHER
